SUMMARY

Security Operations professional combining hands-on SecOps engineering capabilities with extensive IT operations experience and more than 10 years of leadership, operational ownership, and complex problem-solving. Experienced in owning day-to-day IT operations, identity and access management, endpoint support, and network troubleshooting, with hands-on security experience designing detections, investigating incidents, conducting threat hunts and endpoint investigations, and automating security operations. Brings an engineering-focused approach to SecOps by improving detection and visibility, investigating root cause, and building repeatable security workflows.

SKILLS

Security Operations: SIEM, MITRE ATT&CK, Alert Triage, Log Analysis, Security Investigations

Detection, Response & Threat Hunting: Detection Engineering, Incident Response, Endpoint Investigation, Root Cause Analysis, IOC / IOA Analysis

Security Automation & Development: PowerShell, Python, REST APIs, Log Parsing, Workflow Automation

Systems & Endpoint Security: Windows, Linux, Active Directory, Windows Event Logs, Endpoint Telemetry

Networking & Cloud Security: TCP/IP, DNS, Network Traffic Analysis, Firewalls, Azure

SECURITY PROJECTS

SIEM Detection Engineering & Security Monitoring

Splunk Enterprise • SPL • Windows Event Logs • Linux Logs • MITRE ATT&CK • Sysmon

- Built a Splunk-based security monitoring environment to ingest, normalize, and analyze Windows and Linux security telemetry for centralized detection and investigation.
- Developed SPL detection rules for suspicious authentication, process execution, privilege activity, and other attacker behaviors, mapping detections to MITRE ATT&CK techniques.
- Investigated generated alerts by correlating authentication, process, endpoint, and network-related events to distinguish suspicious activity from expected behavior.
- Tested and tuned detections against simulated attack activity, refining search logic and thresholds to reduce false positives and improve detection fidelity.

End-to-End Incident Response Investigation

Splunk Enterprise • Windows Event Logs • Sysmon • PowerShell • MITRE ATT&CK • Windows

- Correlated authentication, process, endpoint, and network telemetry to reconstruct attacker activity and develop a detailed incident timeline.
- Determined root cause, attack path, affected systems, and indicators of compromise by analyzing security telemetry and mapping attacker behavior to MITRE ATT&CK.
- Developed and executed containment, eradication, and recovery actions to remove attacker access, address the initial compromise, and restore the affected environment.
- Produced a professional incident report documenting the attack timeline, evidence, root cause, response actions, and lessons learned, including recommendations for improving future detection and response.

Threat Hunting & Endpoint Investigation

Splunk Enterprise • SPL • Sysmon • Windows Event Logs • PowerShell • Windows • MITRE ATT&CK

- Conducted hypothesis-driven threat hunts across endpoint, authentication, process, network, and DNS telemetry to identify attacker behavior not surfaced by existing alerts.
- Investigated suspicious processes, parent-child process relationships, user activity, network connections, and persistence mechanisms to determine the scope and intent of anomalous behavior.
- Correlated activity across multiple telemetry sources and mapped observed attacker behaviors to MITRE ATT&CK techniques to reconstruct suspicious activity.
- Converted validated hunting findings into new and improved SPL detections, closing visibility gaps identified during investigations.

Security Operations Automation with PowerShell

PowerShell • REST APIs • JSON • Windows Event Logs • Splunk Enterprise • Git

- Engineered a PowerShell-based SecOps automation tool to parse security events, identify suspicious activity, and automate repetitive investigation and triage tasks.
- Integrated REST APIs to automatically enrich IP addresses, domains, and other indicators with external threat intelligence and return contextual data for investigation.
- Developed logic to correlate and prioritize security-event data, reducing manual analysis and producing structured investigation results for analyst review.
- Integrated automated triage and enrichment into the broader detection and incident-response workflow, connecting security monitoring, investigation, and response processes.

PROFESSIONAL EXPERIENCE

IT Operations Lead | Rick Hendrick City Chevrolet

January 2022 - Present

Charlotte, NC

- Served as the primary on-site IT lead, independently managing day-to-day technology operations and resolving technical issues for employees and management.
- Managed identity and access administration, including user provisioning, account changes, access permissions, and account lifecycle support across Okta, Microsoft, eLead, and dealership systems.
- Diagnosed and resolved hardware, software, endpoint, connectivity, and network issues, minimizing downtime and reducing reliance on external IT support.
- Performed periodic user access reviews, identifying outdated accounts and unnecessary permissions and coordinating remediation to maintain appropriate least-privilege access.

EDUCATION

Western Governors University

June 2026

Bachelor of Science, Information Technology
